## JEE Main 2020 Paper

Date of Exam: 7 ${ }^{\text {th }}$ January 2020 (Shift 1)
Time: 9:30 am- 12:30 pm
Subject: Physics

1. Which of the following gives reversible operation?
a.

b.

c.

d.

Solution: (c)

Since, there is only one input hence the operation is reversible.
2. A 60 HP electric motor lifts an elevator with a maximum total load capacity of 2000 kg . If the frictional force on the elevator is 4000 N , the speed of the elevator at full load is close to (Given $1 \mathrm{HP}=746 \mathrm{~W}, g=10 \mathrm{~m} / \mathrm{s}^{2}$ )
a. $\quad 1.9 \mathrm{~m} / \mathrm{s}$
b. $\quad 1.7 \mathrm{~m} / \mathrm{s}$
c. $2 \mathrm{~m} / \mathrm{s}$
d. $\quad 1.5 \mathrm{~m} / \mathrm{s}$

Solution:(a)
Friction will oppose the motion

$$
\begin{aligned}
& \text { Net force }=2000 g+4000=24000 \mathrm{~N} \\
& \text { Power of lift }=60 \mathrm{HP} \\
& \text { Power }=\text { Force } \times \text { Velocity } \\
& v=\frac{P}{F}=\frac{60 \times 746}{24000} \\
& v=1.86 \mathrm{~m} / \mathrm{s}
\end{aligned}
$$

3. A LCR circuit behaves like a damped harmonic oscillator. Comparing it with a physical spring-mass damped oscillator having damping constant b , mass m and oscillating with a force constant k , the correct equivalence will be
a. $\quad L \leftrightarrow m, C \leftrightarrow \frac{1}{k}, R \leftrightarrow b$
b. $\quad L \leftrightarrow \frac{1}{b}, C \leftrightarrow \frac{1}{m}, R \leftrightarrow \frac{1}{k}$
c. $\quad L \leftrightarrow k, C \leftrightarrow b, R \leftrightarrow m$
d. $\quad L \leftrightarrow m, C \leftrightarrow k, R \leftrightarrow b$

Solution:(a)
For damped oscillator by Newton's second law

$$
\begin{aligned}
& -k x-b v=m a \\
& k x+b v+m a=0 \\
& k x+b \frac{d x}{d t}+m \frac{d^{2} x}{d t^{2}}=0
\end{aligned}
$$

For LCR circuit by KVL

$$
\begin{aligned}
& -I R-L \frac{d I}{d t}-\frac{q}{c}=0 \\
& \Longrightarrow I R+L \frac{d I}{d t}+\frac{q}{c}=0 \\
& \Longrightarrow \frac{q}{c}+R \frac{d q}{d t}+L \frac{d^{2} q}{d t^{2}}=0
\end{aligned}
$$

By comparing

$$
\begin{aligned}
& R \Longrightarrow b \\
& c \Longrightarrow \frac{1}{k} \\
& m \Longrightarrow L
\end{aligned}
$$

4. As shown in the figure, a bob of mass $m$ is tied by a massless string whose other end portion is wound on a flywheel (disc) of radius R and mass m . When released from the rest, the bob starts falling vertically. When it has covered a distance $h$, the angular speed of the wheel will be (there is no slipping between string and wheel)
a. $\frac{1}{R} \sqrt{\frac{4 g h}{3}}$
b. $\frac{1}{R} \sqrt{\frac{2 g h}{3}}$
c. $R \sqrt{\frac{2 g h}{3}}$
d. $\quad R \sqrt{\frac{4 g h}{3}}$

Solution:(a)
By energy conservation,

$$
\begin{gather*}
m g h=\frac{1}{2} m v^{2}+\frac{1}{2} I \omega^{2} \\
\Rightarrow g h=\frac{v^{2}}{2}+\frac{\omega^{2} R^{2}}{4} \tag{1}
\end{gather*}
$$

Since the rope is inextensible and also it is not slipping,

$$
\begin{equation*}
\therefore v=R \omega \tag{2}
\end{equation*}
$$

from eq. (1) and (2)

$$
\begin{aligned}
& g h=\frac{\omega^{2} R^{2}}{2}+\frac{\omega^{2} R^{2}}{4} \\
& \Rightarrow g h=\frac{3}{4} R^{2} \omega^{2} \\
& \Rightarrow \omega^{2}=\frac{4 g h}{3 R^{2}} \\
& \Rightarrow \omega=\frac{1}{R} \sqrt{\frac{4 g h}{3}}
\end{aligned}
$$

5. Three point particles of mass $1 \mathrm{~kg}, 1.5 \mathrm{~kg}$ and 2.5 kg are placed at corners of a right triangle of sides $4 \mathrm{~cm}, 3 \mathrm{~cm}$ and 5 cm as shown. The centre of mass of the system with respect to 1 kg mass is at the point
a. $\quad 0.6 \mathrm{~cm}$ to the right of 1 kg and 2 cm above 1 kg mass
b. $\quad 0.9 \mathrm{~cm}$ to the right of 1 kg and 2 cm above 1 kg mass
c. $\quad 0.9 \mathrm{~cm}$ to the right of 1 kg and 2 cm below 1 kg mass
d. $\quad 0.9 \mathrm{~cm}$ to the right of 1 kg and 1.5 cm above 1 kg mass

Solution: (b)

Taking 1 kg as the origin

$$
x_{c o m}=\frac{m_{1} x_{1}+m_{2} x_{2}+m_{3} x_{3}}{m_{1}+m_{2}+m_{3}}
$$

$$
\begin{aligned}
& x_{\text {com }}=\frac{1 \times 0+1.5 \times 3+2.5 \times 0}{5} \\
& x_{\text {com }}=0.9 \\
& y_{\text {com }}=\frac{m_{1} y_{1}+m_{2} y_{2}+m_{3} y_{3}}{m_{1}+m_{2}+m_{3}} \\
& y_{\text {com }}=\frac{1 \times 0+1.5 \times 0+2.5 \times 4}{5} \\
& y_{\text {com }}=2
\end{aligned}
$$

Centre of mass is at $(0.9,2)$
6. A parallel plate capacitor has plates of area A separated by distance ' $d$ '. It is filled with a dielectric which has a dielectric constant varies as $k(x)=k(1+\alpha x)$, where ' x ' is the distance measured from one of the plates. If ( $\alpha d \ll 1$ ), the capacitance of the system is
a. $\frac{A \varepsilon_{0} k}{d}\left[1+\left(\frac{\alpha d}{2}\right)^{2}\right]$
b. $\frac{A \varepsilon_{0} k}{d}\left[1+\left(\frac{\alpha^{2} d^{d 2}}{2}\right)\right]$
c. $\frac{A \varepsilon_{0} k}{d}[1+\alpha d]$
d. $\frac{A \varepsilon_{0} k}{d}\left[1+\left(\frac{\alpha d}{2}\right)\right]$

Solution:(d)

Given, $k(x)=k(1+\alpha x)$
$\mathrm{dC}=\frac{A \varepsilon_{0} k}{d x}$
Since all capacitance are in series, we can apply

$$
\frac{1}{C e q}=\int \frac{1}{d C}=\int_{0}^{d} \frac{d x}{k(1+\alpha x) \epsilon_{0} A}
$$

$$
\frac{1}{C e q}=\left[\frac{\ln (1+\alpha x)}{k \epsilon_{0} A \alpha}\right]_{0}^{d}
$$

On putting the limits from 0 to d

$$
=\frac{\ln (1+\alpha d)}{k \epsilon_{0} A \alpha}
$$

Using expression $\ln (1+x)=x-\frac{x^{2}}{2}+\ldots$
And putting $x=\alpha d$ where, x approaches to 0 .

$$
\begin{gathered}
\frac{1}{C}=\frac{d}{k \epsilon_{0} A d \alpha}\left[\alpha d-\frac{(\alpha d)^{2}}{2}\right] \\
\frac{1}{C}=\frac{d}{k \epsilon_{0} A}\left[1-\frac{\alpha d}{2}\right] \\
C=\frac{k \epsilon_{0} A}{d}\left[1+\frac{\alpha d}{2}\right]
\end{gathered}
$$

7. The time period of revolution of an electron in its ground state orbit in a hydrogen atom is $1.6 \times 10^{-16} s$. The frequency of the electron in its first excited state (in $s^{-1}$ ) is :
a. $\quad 7.8 \times 10^{14}$
b. $\quad 7.8 \times 10^{16}$
c. $\quad 3.7 \times 10^{14}$
d. $\quad 3.7 \times 10^{16}$

Solution:(a)
Time period is proportional to $\frac{n^{3}}{Z^{2}}$.
Let $T_{1}$ be the time period in ground state and $T_{2}$ be the time period in it's first excited state.

$$
T_{1}=\frac{n^{3}}{2^{2}}
$$

(Where, $\mathrm{n}=$ excitation level and 2 is atomic no.)

$$
\frac{T_{1}}{T_{2}}=\left(\frac{n_{1}}{n_{2}}\right)^{3}
$$

Given,

$$
T_{1}=1.6 \times 10^{-16} s
$$

So,

$$
\begin{aligned}
& \frac{1.6 \times 10^{-16}}{T 2}=\left(\frac{1}{2}\right)^{3} \\
& T_{2}=12.8 \times 10^{-16} \mathrm{~s}
\end{aligned}
$$

Frequency is given by $f=\frac{1}{T}$

$$
f=\frac{1}{12.8} \times 10^{16} \mathrm{~Hz}
$$

$$
f=7.8128 \times 10^{14} \mathrm{~Hz}
$$

8. The current ( $i_{1}$ ) (in A) flowing through $1 \Omega$ resistor in the following circuit is
a. $\quad 0.20 \mathrm{~A}$
b. $\quad 0.30 \mathrm{~A}$
c. $\quad 0.50 \mathrm{~A}$
d. 0.25 A

Solution:(a)

Net resistance across CD $=\frac{1}{2} \Omega$
Net resistance across $\mathrm{BE}=2+\frac{1}{2}=\frac{5}{2} \Omega$
Net resistance across $\mathrm{BE}=\frac{\frac{5}{2} \times 2}{\frac{5}{2}+2}=\frac{10}{9} \Omega$.
Total current in circuit $=\frac{V}{R}=\frac{9}{10} \mathrm{~A}$
In the given circuit, voltage across $\mathrm{BE}=$ voltage across $\mathrm{BF}=1 \mathrm{~V}$
Current across BE $=\frac{V_{B E}}{R}=\frac{2}{5} \mathrm{~A}$
Current across CD and DE will be same which is $\frac{2}{5} \mathrm{~A}$.
Now, current across any $1 \Omega$ resistor will be same and given by $=I=\frac{1}{2} \times \frac{2}{5}=\frac{1}{5}=0.20 \mathrm{~A}$
9. A rocket of mass $m$ is launched vertically upward with an initial speed $u$ from the surface of the earth. After it reaches height $R(R=$ radius of earth), it ejects a satellite of mass $m / 10$ so that subsequently the satellite moves in a circular orbit. The kinetic energy of the satellite is ( $\mathrm{G}=$ gravitational constant; M is the mass of earth)
a. $\frac{3 m}{8}\left[u+\sqrt{\frac{5 G M}{6 R}}\right]^{2}$
b. $\frac{m}{20}\left[u-\sqrt{\frac{2 G M}{3 R}}\right]^{2}$
c. $5 m\left[u^{2}-\frac{119}{200} \frac{G M}{R}\right]$
d. $\frac{m}{20}\left[u^{2}+\frac{113}{200} \frac{G M}{R}\right]$

Solution:(c)
As we know,

$$
\begin{align*}
& T . E_{\text {ground }}=T . E_{R} \\
& \frac{1}{2} m u^{2}+\left(\frac{-G M m}{R}\right)=\frac{1}{2} m v^{2}+\left(\frac{-G M m}{2 R}\right) \\
& \frac{1}{2} m v^{2}=\frac{1}{2} m u^{2}+\left(\frac{-G M m}{2 R}\right) \\
& v^{2}=u^{2}+\left(\frac{-G M m}{R}\right)  \tag{1}\\
& \Longrightarrow v=\sqrt{u^{2}+\left(\frac{-G M m}{R}\right)}
\end{align*}
$$

The rocket splits at height $R$. Since, sepration of rocket is impulsive therefore conservation of momentum in both radial and tangential direction can be applied.

$$
\begin{aligned}
\frac{m}{10} V_{T} & =\frac{9 m}{10} \sqrt{\frac{G M}{2 R}} \\
\frac{m}{10} V_{r} & =m \sqrt{u^{2}-\frac{G M}{R}}
\end{aligned}
$$

Kinetic energy of satellite $=\frac{1}{2} \times \frac{m}{10}\left(V_{T}^{2}+V_{R}^{2}\right)=\frac{m}{20}\left(81 \frac{G M}{2 R}+100 u^{2}-100 \frac{G M}{R}\right)$

$$
\begin{aligned}
& =\frac{m}{20}\left(100 u^{2}-\frac{119 G M}{2 R}\right) \\
& \quad=5 m\left(u^{2}-\frac{119 G M}{200 R}\right)
\end{aligned}
$$

10. A long solenoid of radius R carries a time $(t)$ dependent current $I(t)=I_{0} t(1-t)$. A ring of radius $2 R$ is placed coaxially to the middle. During the time instant $0 \leq t \leq 1$, the induced current $\left(I_{R}\right)$ and the induced EMF $\left(V_{R}\right)$ in the ring changes as
a. Current will change its direction and its emf will be zero at $t=0.25 \mathrm{sec}$.
b. Current will not change its direction and its emf will be maximum at $t=0.5 \mathrm{sec}$.
c. Current will not change direction and emf will be zero at $t=0.25 \mathrm{sec}$.
d. Current will change its direction and its emf will be zero at $t=0.5 \mathrm{sec}$.

Solution:(d)

Field due to solenoid near the middle $=\mu_{o} N I$

$$
\begin{aligned}
& \text { Flux, } \quad \phi=B A \quad \text { where }\left(A=\pi(R)^{2}\right) \\
& =\mu_{o} N I_{o} t(1-t) \pi R^{2} \\
& E=-\frac{d \phi}{d t} \quad[\text { By Lenz's law }] \\
& E=-\frac{d}{d t}\left(\mu_{o} N I_{o} t(1-t)^{2}\right) \\
& E=-\mu_{o} N I_{o} \pi R^{2} \frac{d}{d t}[t(1-t)] \\
& E=-\pi \mu_{o} I_{o} N R^{2}(1-2 t)
\end{aligned}
$$

Current will change its direction when EMF will be zero

$$
\begin{gathered}
\Longrightarrow \quad(1-2 t)=0 \\
\text { So, } \quad t=0.5 \mathrm{sec}
\end{gathered}
$$

11. The radius of gyration of a uniform rod of length $l$ about an axis passing through a point $l / 4$ away from the center of the rod and perpendicular to its axis is
a. $\quad \sqrt{\frac{7}{48}} l$
b. $\quad \sqrt{\frac{5}{48}} l$
c. $\quad \sqrt{\frac{7}{24}} l$
d. $\sqrt{\frac{19}{24}} l$

Solution:(a)

Moment of inertia of rod about axis perpendicular to it passing through its centre is given by

$$
\begin{aligned}
I & =\frac{M l^{2}}{12}+M\left(\frac{l}{4}\right)^{2} \\
& =\frac{3 M l^{2}+4 M l^{2}}{48} \\
& =\frac{7 M l^{2}}{48}
\end{aligned}
$$

Now, comparing with $I=M k^{2}$ where $k$ is the radius of gyration

$$
\begin{aligned}
& k=\sqrt{\frac{7 l^{2}}{48}} \\
& k=l \sqrt{\frac{7}{48}}
\end{aligned}
$$

12. Two moles of an ideal gas with $\frac{C_{p}}{C_{v}}=5 / 3$ are mixed with 3 moles of another ideal gas with $\frac{C_{p}}{C_{v}}=4 / 3$. The value of $\frac{C_{p}}{C_{v}}$ for the mixture is
a. $\quad 1.38$
b. 1.42
c. $\quad 1.50$
d. 1.70

Solution:(b)

For first gas having $\gamma=\frac{C_{p}}{C_{v}}=\frac{5}{3}$
Using formula $C_{p}=\frac{R \gamma}{\gamma-1}$
$C_{v}=\frac{R}{\gamma-1}$
$C_{p}=\frac{5 R}{2} \quad C_{v}=\frac{3 R}{2}$
Similarly for $2^{\text {nd }}$ gas having $\gamma=\frac{C_{p}}{C_{v}}=\frac{4}{3}$

$$
C_{p}=4 R \quad C_{v}=3 R
$$

$$
\text { Now } \gamma \text { of mixture }=\frac{n_{1} C_{p_{1}}+n_{2} C_{p_{2}}}{n_{1} C_{v_{1}}+n_{2} C_{v_{2}}}
$$

Given that $n_{1}=2$ and $n_{2}=3$

$$
\gamma=\frac{2 \times \frac{5 R}{2}+3 \times 4 R}{2 \times \frac{3 R}{2}+3 \times 3 R}=\frac{17}{12}=1.42
$$

13. 1 liter dry air at STP expands adiabatically to a volume of $3 L$. If $\gamma=1.4$, the work done by air is $\left(3^{1.4}=4.655\right)$ (take air to be an ideal gas)
a. $\quad 100.8 \mathrm{~J}$
b. $\quad 90.5 \mathrm{~J}$
c. 45 J
d. 18 J

Solution:(b)
Given, $P_{1}=1 \mathrm{~atm}, T_{1}=273 \mathrm{~K}$ (At STP)
In adiabatic process,

$$
\begin{gathered}
P_{1} V_{1}^{\gamma}=P_{2} V_{2}^{\gamma} \\
P_{2}=P_{1}\left[\frac{V_{1}}{V_{2}}\right]^{\gamma} \\
P_{2}=1 \times\left[\frac{1}{3}\right]^{1.4} \\
P_{2}=0.2164 \mathrm{~atm}
\end{gathered}
$$

Work done in adiabatic process is given by

$$
\begin{aligned}
W & =\frac{P_{1} V_{1}-P_{2} V_{2}}{\gamma-1} \\
W & =\frac{1 \times 1-3 \times .2164}{0.4} \times 101.325
\end{aligned}
$$

Since, $1 \mathrm{~atm}=101.325 \mathrm{kPa}$ and 1 Liter $=10^{-3} \mathrm{~m}^{3}$

$$
W=89.87 \mathrm{~J}
$$

14. Given magnetic field equation is $\vec{B}=3 \times 10^{-8} \sin (\omega t-k x+\phi) \hat{j}$ then appropriate equation for electric field $(\vec{E})$ will be
a. $\quad 20 \times 10^{-9} \sin (\omega t-k x+\phi) \hat{k}$
b. $\quad 9 \sin (\omega t-k x+\phi) \hat{k}$
c. $16 \times 10^{-9} \sin (\omega t-k x+\phi) \hat{k}$
d. $3 \times 10^{-9} \sin (\omega t-k x+\phi) \hat{k}$

Solution:(b)

We know that,

$$
\begin{aligned}
& \left|\frac{E_{0}}{B_{0}}\right|=c \\
& B_{0}=3 \times 10^{-8} \\
& \Longrightarrow E_{0}=B_{0} \times c=3 \times 10^{-8} \times 3 \times 10^{8} \\
& =9 N / C \\
& \therefore E=E_{o} \sin (\omega t-k x+\phi) \hat{k}=9 \sin (\omega t-k x+\phi) \hat{k}
\end{aligned}
$$

15. A polarizer analyzer set is adjusted such that the intensity of light coming out of the analyzer is just $10 \%$ of the original intensity. Assuming that the polarizer analyzer set does not absorb any light, the angle by which the analyzer needs to be rotated further to reduce the output intensity to be zero is
a. $45^{\circ}$
b. $\quad 71.6^{\circ}$
c. $90^{\circ}$
d. $\quad 18.4^{0}$

Solution: (d)

$$
\begin{aligned}
& \text { Intensity after polarisation through polaroid }=I_{o} \cos ^{2} \phi \\
& \text { So, } 0.1 I_{o}=I_{o} \cos ^{2} \phi \\
& \Rightarrow \cos \phi=\sqrt{0.1} \\
& \Rightarrow \cos \phi=0.316
\end{aligned}
$$

Since, $\cos \phi<\cos 45^{\circ}$ therefore, $\phi>45^{\circ}$ If the light is passing at $90^{\circ}$ from the plane of polaroid, than its intensity will be zero.
Then, $\theta=90^{\circ}-\phi$ therfore, $\theta$ will be less than $45^{\circ}$. So, the only option matching is option d which is $18.4^{\circ}$
16. Speed of transverse wave of a straight wire having mass 6.0 g , length 60 cm and area of cross-section $1.0 \mathrm{~mm}^{2}$ is $90 \mathrm{~m} / \mathrm{s}$. If the Young's modulus of wire is $1.6 \times 10^{11} \mathrm{Nm}^{-2}$, the extension of wire over its natural length is
a. $\quad 0.3 \mathrm{~mm}$
b. $\quad 0.2 \mathrm{~mm}$
c. $\quad 0.1 \mathrm{~mm}$
d. $\quad 0.4 \mathrm{~mm}$

## Solution:(a)

Given, $M=6$ grams $=6 \times 10^{-3} \mathrm{~kg}$

$$
\begin{aligned}
L & =60 \mathrm{~cm}=0.6 \mathrm{~m} \\
A & =1 \mathrm{~mm}^{2}=1 \times 10^{-6} \mathrm{~m}^{2}
\end{aligned}
$$

Using the relation, $v^{2}=\frac{T}{\mu}$
$\Rightarrow T=\mu v^{2}=V^{2} \times \frac{M}{L}$

$$
\begin{aligned}
& \text { As Young's modulus, } Y=\frac{\text { stress }}{\text { strain }} \\
& \qquad \begin{aligned}
& \text { Strain }=\frac{\text { Stress }}{Y}=\frac{T}{A Y} \\
& \text { Strain }=\frac{\Delta L}{L}=\frac{V^{2} \frac{M}{L}}{A Y}=V^{2} \frac{M}{A Y L} \\
& \Rightarrow \Delta L=\frac{V^{2} M}{A Y} \\
& \Delta L=\frac{8100 \times 6 \times 10^{-3}}{1 \times 10^{-6} \times 1.6 \times 10^{11}} \\
& \Delta L=0.3 \mathrm{~mm}
\end{aligned}
\end{aligned}
$$

17. Two infinite planes each with uniform surface charge density $+\sigma C / m^{2}$ are kept in such a way that the angle between them is $30^{\circ}$. The electric field in the region shown between them is given by:

a. $\quad \frac{\sigma}{2 \epsilon_{0}}\left[\left(1-\frac{\sqrt{3}}{2}\right) \hat{y}-\frac{1}{2} \hat{x}\right]$
b. $\frac{\sigma}{2 \epsilon_{0}}\left[\left(1+\frac{\sqrt{3}}{2}\right) \hat{y}-\frac{1}{2} \hat{x}\right]$
c. $\frac{\sigma}{2 \epsilon_{0}}\left[\left(1-\frac{\sqrt{3}}{2}\right) \hat{y}+\frac{1}{2} \hat{x}\right]$
d. $\frac{\sigma}{2 \epsilon_{0}}\left[\left(1+\frac{\sqrt{3}}{2}\right) \hat{y}+\frac{1}{2} \hat{x}\right]$

Solution:(a)

Field due to single plate $=\frac{\sigma}{2 \epsilon_{o}}=\left[\vec{E}_{1}\right]=\left[\overrightarrow{E_{2}}\right]$
Net electric field $\vec{E}=\overrightarrow{E_{1}}+\overrightarrow{E_{2}}$
$=\frac{\sigma}{2 \epsilon_{0}} \cos 30^{0}(-\hat{j})+\frac{\sigma}{2 \epsilon_{0}} \sin 30^{0}(-\hat{i})+\frac{\sigma}{2 \epsilon_{0}}(\hat{j})$
$=\frac{\sigma}{2 \epsilon_{0}}\left(1-\frac{\sqrt{3}}{2}\right)(\hat{j})-\frac{\sigma}{4 \epsilon_{0}}(\hat{i})$
$=\frac{\sigma}{2 \epsilon_{0}}\left[\left(1-\frac{\sqrt{3}}{2}\right) \hat{y}-\frac{1}{2} \hat{x}\right]$
18. If we need a magnification of 375 from a compound microscope of tube length 150 mm and an objective lens of focal length 5 cm , the focal length of the eye-piece should be close to:
a. $\quad 12 \mathrm{~mm}$
b. $\quad 33 \mathrm{~mm}$
c. 2 mm
d. 7 mm

## Solution:(c)

Magnification of compound microscope for least distance of distinct vision setting(strained eye)

$$
M=\frac{L}{f_{0}}\left(1+\frac{D}{f_{e}}\right)
$$

where L is the tube length
$f_{0}$ is the focal length of objective
D is the least distance of distinct vision $=25 \mathrm{~cm}$

$$
\begin{array}{ll}
\text { i.e. } & 375=\frac{150 \times 10^{-3}}{5 \times 10^{-2}}\left(1+\frac{25 \times 10^{-2}}{f_{e}}\right) \\
\text { i.e. } & 125=1+\frac{25 \times 10^{-2}}{f_{e}} \\
\text { i.e. } & \frac{25 \times 10^{-2}}{f_{e}}=125 \\
& \therefore \quad f_{e} \approx 2 \times 10^{-3} \mathrm{~m}=2 \mathrm{~mm}
\end{array}
$$

19. Visible light of wavelength $6000 \times 10^{-8} \mathrm{~cm}$ falls normally on a single slit and produces a diffraction pattern. It is found that the second diffraction minima is at $60^{\circ}$ from the central maxima. If the first minimum is produced at $\theta$, then $\theta$ is close to
a. $25^{\circ}$
b. $45^{\circ}$
c. $20^{\circ}$
d. $35^{\circ}$

Solution:(a)
For single slit diffraction experiment:
Angle of minima are given by

$$
\begin{align*}
& \sin \theta_{n}=\frac{n \lambda}{d} \quad\left(\sin \theta_{n} \neq \theta_{n} \text { as } \theta \text { is large }\right) \\
& \sin \theta_{2}=\sin 60^{\circ}=\frac{\sqrt{3}}{2}=\frac{2 \lambda}{d}=\frac{2 \times 6000 \times 10^{-10}}{d}  \tag{1}\\
& \sin \theta_{1}=\frac{\lambda}{d}=\frac{6000 \times 10^{-10}}{d} \tag{2}
\end{align*}
$$

Dividing (1) and (2)

$$
\Longrightarrow \quad \frac{\sqrt{3}}{2 \sin \theta_{1}}=2 \Longrightarrow \sin \theta_{1}=\frac{\sqrt{3}}{4}=0.43
$$

As, the value is coming less than $30^{\circ}$ the only available option are $20^{\circ}$ and $25^{\circ}$ but by using approximation we get $\theta_{1}=25^{\circ}$
20. Consider a coil of wire carrying current $I$, forming a magnetic dipole placed in an infinite plane. If $\phi_{i}$ is the magnitude of magnatic flux through the inner region and $\phi_{o}$ is magnitude of magnetic flux through outer region then which of the following is correct?
a. $\quad \phi_{i}=-\phi_{o}$
b. $\quad \phi_{i}>\phi_{o}$
c. $\quad \phi_{i}<\phi_{o}$
d. $\quad \phi_{i}=\phi_{o}$

Solution:(a)

As magnetic field line of ring will form close loop therefore all outgoing from circular hole passing through the infinite plate.
$\therefore \phi_{1}=-\phi_{0}$ (because the magnetic field lines going inside is equal to the magnetic field lines coming out.)
21. A particle of mass 1 kg slides down a frictionless track AOC starting from rest at $\mathrm{A}($ height 2 m$)$. After reaching C particle continues to move freely in air as a projectile. When it reaches its highest point $\mathrm{P}(\mathrm{h}=1 \mathrm{~m})$ the kinetic energy of the particle (in $J$ ) is $\qquad$ (take $g=10 \mathrm{~m} / \mathrm{s}^{2}$ )

Solution:(10)

As the particle starts from rest the total energy at point $A=m g h=T . E_{A}$ ( where $h=2 m$ ) After reaching point P

$$
T . E_{c}=K . E .+m g h
$$

By conservation of energy

$$
\begin{aligned}
& T \cdot E_{A}=T \cdot E_{p} \\
& \quad \Longrightarrow K \cdot E \cdot=m g h=10 \mathrm{~J}
\end{aligned}
$$

22. A carnot engine operates between two reservoirs of temperature 900 K and 300 K . The engine performs 1200 $J$ of work per cycle. The heat energy in $(J)$ delivered by the engine to the low temperature reservoir in a cycle is
$\qquad$
Solution:(600 J)

$$
\eta=1-\frac{T_{2}}{T_{1}}=1-\frac{300}{900}=\frac{2}{3}
$$

Given, $W=1200 J$
From conservation of energy

$$
\begin{aligned}
& Q_{1}-Q_{2}=W \\
& \eta=\frac{Q_{1}-Q_{2}}{Q_{1}}=\frac{W}{Q_{1}} \Longrightarrow Q_{1}=1800 \mathrm{~J} \\
& \Rightarrow Q_{2}=Q_{1}-W=600 \mathrm{~J}
\end{aligned}
$$

23. A loop $A B C D E F A$ of straight edges has a six corner points $\mathrm{A}(0,0,0), \mathrm{B}(5,0,0), \mathrm{C}(5,5,0), \mathrm{D}(0,5,0), \mathrm{E}(0,5,5)$, $\mathrm{F}(0,0,5)$. The magnetic field in this region is $\vec{B}=(3 \hat{i}+4 \hat{k}) T$. The quantity of the flux through the loop $A B C D E F A$ (in $W b$ ) is $\qquad$
Solution:(175)

As we know, magnetic flux $=\vec{B} \cdot \vec{A}$

$$
\begin{aligned}
& \Longrightarrow\left(B_{x}+B_{z}\right) \cdot\left(A_{x}+A_{z}\right) \\
& \Longrightarrow(3 \hat{i}+4 \hat{k}) \cdot(25 \hat{i}+25 \hat{k}) \\
& \Longrightarrow(75+100) W b \\
& \Longrightarrow 175 \mathrm{~Wb}
\end{aligned}
$$

24. A beam of electromagnetic radiation of intensity $6.4 \times 10^{-5} \mathrm{~W} / \mathrm{cm}^{2}$ is comprised of wavelength, $\lambda=310 \mathrm{~nm}$. It falls normally on a metal (work function 2 eV ) of surface area $1 \mathrm{~cm}^{2}$. If one in $10^{3}$ photons ejects an electron, total number of electrons ejected in $1 s$ is $10^{x}\left(h c=1240 \mathrm{eV}-n m, 1 \mathrm{eV}=1.6 \times 10^{-19} \mathrm{~J}\right)$, then the value of x is $\qquad$
Solution:(11)

$$
\begin{aligned}
P & =\text { Intensity } \times \text { Area } \\
& =6.4 \times 10^{-5} \mathrm{~W}-\mathrm{cm}^{-2} \times 1 \mathrm{~cm}^{2} \\
& =6.4 \times 10^{-5} \mathrm{~W}
\end{aligned}
$$

For photoelectric effect to take place, energy should be greater than work function
Now,

$$
E=\frac{1240}{310}=4 \mathrm{eV}>2 \mathrm{eV}
$$

Therefore, photoelectric effect takes place
Here n is the number of photons emitted.

$$
\begin{array}{r}
n \times E=I \times A \\
\Longrightarrow n=\frac{I A}{E}=\frac{6.4 \times 10^{-5}}{6.4 \times 10^{-19}}=10^{14}
\end{array}
$$

Where, n is number of incident photon
Since, 1 out of every 1000 photons are sucessfull in ejecting 1 photoelectron

Therefore, the number of photoelectrons emitted is

$$
\begin{aligned}
& =\frac{10^{14}}{10^{3}} \\
& \therefore x=11
\end{aligned}
$$

25. A non- isotropic solid metal cube has coefficient of linear expansion as $5 \times 10^{-5} /{ }^{\circ} \mathrm{C}$ along the x-axis and $5 \times 10^{-6} /{ }^{\circ} \mathrm{C}$ along y-axis and z-axis. If the coefficient of volumetric expansion of the solid is $n \times 10^{-6} /{ }^{\circ} \mathrm{C}$ then the value of $n$ is $\qquad$ --

Solution:(60)
We know that, $V=x y z$

$$
\begin{aligned}
& \frac{\Delta v}{v}=\frac{\Delta x}{x}+\frac{\Delta y}{y}+\frac{\Delta z}{\Delta z} \\
& \frac{1}{T} \frac{\Delta v}{v}=\frac{1}{T} \frac{\Delta x}{x}+\frac{1}{T} \frac{\Delta y}{y}+\frac{1}{T} \frac{\Delta z}{z} \\
& y=\alpha_{n}+\alpha_{y}+\alpha_{z} \\
& y=50 \times 10^{-6} /{ }^{\circ} C+5 \times 10^{-6} /{ }^{\circ} C+5 \times 10^{-6} /{ }^{\circ} C \\
& y=60 \times 10^{-6} /{ }^{\circ} C \\
& \therefore n=60
\end{aligned}
$$
